Syllabus
CMSC 140: Introduction to programming

Spring 2021

v20210113-0515

Section 1:	MWF 9:55, Rotunda 115 (and via Zoom)
Section 2:	MWF 11:00, Rotunda 115 (and via Zoom)
Websites:	`https://canvas.longwood.edu/courses/1300130`
	`http://cs.longwood.edu/courses/cmsc140`

A first course in computer programming, intended for students with no previous experience in writing computer programs. Emphasis will be placed on practical programming skills; assignments will primarily use the Python programming language. Students will cover the fundamental control structures and will learn to process real data stored in sequential lists and in key-value pairs. Students may not enroll in this course if CMSC 160 has already been completed. 3 credits. FQRC, SI.

Professor:	Don Blaheta
Office:	Rotunda 334
Phone:	x2191
Email:	`blahetadp@longwood.edu`
Office hours:	Mondays 4–5pm; Tuesdays 11–noon;
	Wednesdays 2:30–3:30pm; Thursdays 2–3pm

Overview

In the last decade, we have seen huge increases in the computational thinking required in a wide variety of disciplines; across the natural and social sciences, the arts, and even in the humanities, researchers and practitioners are finding that they have data, they need to process it, and no completely off-the-shelf solution will do. They need to write a program to solve a problem.

In this course, we will introduce the concepts and ways of thinking required to write straightforward programs to process a variety of kinds of data.

Textbook and resources

The textbook is *A Practical Introduction to Python Programming*, by Brian Heinold. It is free and can be found online.[1] There will be regular in-class and out-of-class assignments drawn from the book.

You will be expected to have a computer that can connect to the internet and various websites, including one called `codeboard.io`, which is where you will be writing your programs. Some days are designated lab/laptop days, and if you are attending in-person you'll be expected to bring your laptop with you on those days. A phone/tablet is not sufficient for this.

You will be expected to have a device (your computer, or a phone or tablet) that is capable of recording and playing audio and video, and connecting to a live meeting via Zoom.

You will be expected to have reasonable bandwidth to connect to meetings, work on assignments, and occasionally upload video, *at your home* or wherever you plan to go in the event the campus closes down. If this is likely to be a problem, contact me early to see if we will be able to work around it.

You will be expected to have (and wear) a mask or the equivalent.

Covid-19 notes

There are a number of policies specific to running a class in a pandemic that I wanted to put early in the syllabus to get your attention.

Attending class. There are two ways you can attend class: in person, or via Zoom link. Either mode of attendance is equivalent for purposes of evaluating your presence and participation; if you attend via Zoom link,

- you must have a reason, and
- you must say what it is,

but I don't need any medical detail and if it's not directly covid-related I'm not going to police that. (Basically: be an adult and make good choices.) I will make every effort to make the Zoom link experience as equivalent as possible to the in-person experience. For regular attendance via Zoom, I *strongly* encourage you to have your video on most or all of the time—this leads to

[1] `https://www.brianheinold.net/python/python_book.html`

better better engagement for yourself, for me, and for your classmates—but I do not require it. (Here again: be an adult and make good choices.) If you are on Zoom on a day that you present something, I *will* expect you to connect with video, at least for that part, unless you have contacted me *in advance*.

Attendance groups. Our classroom will not hold us all! You should have received an email from me assigning you to either the A group or the B group. Each day in the calendar is designated as A or B, and that group will attend in-person only on their designated days. Everybody not attending in person on any given day should plan to attend via Zoom.

Medical needs. There are a number of medical reasons why attending class in person may not be appropriate for you. Obviously, if you receive a positive Covid-19 test, you will need to remain in isolation and attend class via Zoom link. Even without a positive confirmation, if you are feeling even mild symptoms or have been exposed or are awaiting test results, attending via Zoom link from quarantine is most appropriate. Furthermore, if you or someone in your immediate household is in a high-risk group, attending via Zoom link over the longer term (and perhaps for the whole semester) may be most appropriate for you; please contact `questions@longwood.edu` to formally request this accommodation, which I will be happy to work with.

> **More serious medical needs.** If you are feeling serious symptoms of Covid-19 (or some other sickness), your priority should be on dealing with that. If you end up missing class sessions and/or assignments due to being sick, notify me when you can and then let me know when you're on the upswing so we can plan out how to get you caught up.

Wearing a mask. If you are attending the class in person, you must be wearing a mask or other appropriate face covering. Coverings that are acceptable include some kinds of folded bandannas, gaiters, or scarves, as long as: it covers both your nose and mouth, with two layers of cloth, fitted relatively snugly around the edges, and reduces aerosols (i.e. it's relatively tightly woven, not very stretchy, and doesn't have an "exhaust port").[2][3] If you are medically unable to wear a mask, my accommodation is the same as for other medical

[2]Note that, unfortunately, the masks Longwood is distributing don't meet its own policy. Unless you add filters and do some alterations to them, they are *at best* emergency backup masks, and a folded bandanna provides better masking.

[3]If you have a mask with a port that you want to wear, it is possible to cover the port to ensure it's filtered. Contact me to work this out.

needs: you can attend via Zoom link. If you show up to class without a face covering, you will be required to put one on or leave. (Students connected via Zoom link do not need to wear masks, obviously.)

All-online? It's still quite possible that at some point in the semester we'll have to move all-online to handle an outbreak. Should that happen, the main difference for this course will be that *everyone* will Zoom in, and I'll manage the session from my office (or my home) rather than from the classroom. I expect that this course will remain largely synchronous (i.e. we meet at our regular class time) even if we go remote, but some calendar dates may be adjusted.

Course objectives / Student learning outcomes

At the end of this course, the successful student will be able to:

1. write programs to handle both numeric and textual data,
2. use standard programming control constructs such as if/else, loops, and functions,
3. read and process real-world data using flat text files,
4. count, filter, and transform data presented in sequential (list) form, and
5. produce descriptive statistics on numeric data.

Core curriculum objectives. In addition to the course-specific objectives above, this course shares the objectives of the core curriculum as a whole. During this course, the successful student will:

6. engage in creative inquiry and cultivate curiosity,
7. develop foundational knowledge and skills in the discipline (e.g. how to communicate, study, read, etc.), and
8. create and deliver oral messages appropriate to audience, purpose, and context.

Quantitative reasoning objectives. As a Quantitative Reasoning course in the core curriculum, this course shares the following objectives as well. At the end of this course, the successful student will be able to:

9. formulate a question/issue using appropriate mathematical, algorithmic, and/or statistical terms, and explain the decision process behind the choices made in that formulation;

10. use mathematical, algorithmic, and/or statistical methods to gather and/or analyze data—justification of the methods chosen should be included;

11. determine the reasonableness of an answer and/or evaluate the explanations of data for reasonableness, and understand the limitations behind the methods used in the previous outcome; and

12. interpret the results of a mathematical, algorithmic, and/or statistical analysis, and present the interpretation in a context appropriate for a broader audience.

Faculty objectives

Per section II-O-III-F-3 in the faculty manual, faculty teaching this speaking-infused course are expected to:

13. integrate speaking opportunities, exercises, and/or assignments with Core outcomes and individual course objectives, so that students may simultaneously master course content and develop and improve their oral communication skills;

14. provide explicit instruction to aid student understanding of speaking appropriately for audiences in the relevant context or discipline; and

15. provide appropriate and timely peer and/or instructor feedback on student oral communication to allow opportunities for students to improve their performance on subsequent assignments.

Content

Graded work

I figure that I have, on average, about 9 hours of your time every week, including class time as well as reading, practice, homework, and project work. If you find you're regularly spending substantially more time than this, please

do come discuss it with me, so that we can ensure you're making the most effective use of your time. The work you do for this course will be evaluated as follows:

Engagement. You need to be actively engaged in this class. Engagement comes in many forms, but I expect that you will be interacting with your classmates, and with me, both in class (in-person or Zoom) and in the online discussion boards. General engagement will be evaluated in two-week blocks—so you don't need to artificially say a thing every day—and it's ok if most of your engagement is via the discussion boards as long as *some* of it is spoken out loud. In addition, there will be occasional required interactions via Canvas that will be considered part of the engagement grade. Engagement makes up 10% of the course grade, and more than half of that ($> 5\%$) is in the fortnightly general participation blocks.

Lab work (and homework). The central goal of the course is that you learn to program, so the bulk of the work you do will be "lab" work before, during, and after our assigned class periods. This work will make up 25% of the grade. Collaborative

Course project. Your course project will involve working with a data set in your area, building a program to process that data, and writing up your results. Evaluation will be based on the program code itself as well as your written and verbal proposals and conclusions based on the results. The project will be worth a total of 25% of the final grade. Collaborative

Exams. There will be two exams, one in early March and one in late April. **You are not permitted to discuss the exams *at all,* with anyone other than me.** Each exam is worth 20% of the grade. (40% total) Non-collaborative

Grading scale

I tend to grade hard on individual assignments, but compensate for this in the final grades. The grading scale will be approximately as follows:

A−	[85, 90)	A	[90, 95)	A+	[95, 100]
B−	[70, 75)	B	[75, 80)	B+	[80, 85)
C−	[55, 60)	C	[60, 65)	C+	[65, 70)
D−	[40, 45)	D	[45, 50)	D+	[50, 55)

While there will be no "curve" in the statistical sense, I may slightly adjust the scale at the end of the term if it turns out some of the assignments were

too difficult. Final grades of A+ are recorded as an A in the grading system. Final grades below the minimum for D− are recorded as an F.

Note that *individual* grades recorded in Canvas should be accurate (and you should let me know if there's a data entry error!), but *averages* as computed by Canvas sometimes are not, if the averaging is complex or (especially) if an individual student has a special case scenario. The reference gradebook is my own spreadsheet, and while I will try to make Canvas reflect it (including averages) as well as I can, Canvas can't always handle it.

Study and practice

As in many disciplines, the most effective way to learn this material is to *do* it—the first attempt being difficult and often not fully correct, but improving with continued effort and practice. Trying to "study" simply by *reading about* it is not going to be enough (though it's the right place to start). This course is structured to help you study how to program (and to *learn* to study how to program): in general a concept will be first introduced in a reading, after which we'll have some low-stakes in-class practice where the point is to try some things and see what works (and analyse what doesn't). After these supervised attempts, you'll try some more problems on your own, outside of class, with feedback and a grade. When we get to the major assessments, like the exams or the project, you will have been studying for far longer than the day or two leading up to the exam, and you'll be familiar with the kinds of practice you need in order to be successful. SLO 7

Course project

The purpose of the course project (worth a total of 100 points) is for you to connect this course content directly with a professional or personal interest of your own, to perform a complete start-to-finish piece of data analysis using the tools and techniques we'll be developing all semester, and to communicate the intent and results of your inquiry to others. In that sense, it serves to integrate a number of course goals; the technical component (addressing SLOs 1–5) is central but only 40% of the grade, so it's important not to lose sight of the others. An explicit goal of this project is to help you decide what *you* might be curious about, and to encourage you to indulge and pursue that curiosity, and to engage in creative inquiry to answer and feed that curiosity. Another

explicit goal of the project is to serve as content about which you'll need to communicate; this kind of longer-running project gives me a vehicle for a more formal kind of feedback on your communication (and a well-defined place to assess it).

Breakdown

The first piece of this will be to find a core question that is interesting and a data set that can answer it. What makes a question "interesting"? That's largely up to you! You'll submit an initial proposal writeup that includes (a link to) the data set and some explanation of how the data represents information of interest and formulates your (proposed) question in terms of the algorithm you intend to use to solve it; I'll respond to it and (if necessary) help you refine it into something workable. This writeup is worth 12 points. 12 points is 12% of the project grade, and thus 3% of the course grade. SLO 6, 7, 9

After you've settled on a question, you'll give a very brief "elevator speech" to the class—90 second max—telling us what your question is and why it's interesting (to you, and maybe to us as well). 8 points. 8 points is 8% of the project grade, and thus 2% of the course grade. SLO 6, 8, 9

The core of the assignment will of course be to write a program that implements your chosen algorithm to perform the data analysis you need. The program itself will be worth 40 points. 40 points is 40% of the project grade, and thus 10% of the course grade. SLO 1–5, 6, 10

In the last week or so of the course, after you've done most or all of the implementation work, you'll give a "lightning talk" (same as an elevator speech, but more technical) that explains to us what your algorithm will do and how it will answer your question. 16 points. 16 points is 16% of the project grade, and thus 4% of the course grade. SLO 7, 8

After you have successfully run your algorithm to perform the data analysis, the final step is to interpret its output. You'll also give a final elevator speech that presents your result, explaining why it is reasonable (i.e. not obviously the result of a bug!), and what the numbers mean in the context of the problem—answering your original core question. You'll also distill the entire QR process into a written summary of the result. The speech is 16 points; the writeup is 8. 16 points is 16% of the project grade, and thus 4% of the course grade. 8 points is 8% of the project grade, and thus 2% of the course grade. SLO 11, 12 SLO 8, 12

The speaking infusion

This course offers many opportunities to develop your speaking skills, and provides a sort of ramp from low-stakes speaking opportunities, with feedback, leading up to the speaking worth more points at the end of the semester. At each stage, you will receive explicit instruction in each speaking style used in this course. SLO 7, 8; FO 13–15

As part of the participation grade, there will be frequent and regular chances to explain problems and answers in small groups with your classmates. These points will be nearly automatic (if you're present and participating), and as I circulate around the room to answer questions I can also give some light feedback. SLO 7, 8; FO 13, 15

The first elevator speech (see "Course project" above) will be the first of the speaking opportunities you can specifically plan for, and thus will be held to a somewhat higher standard; but it is still only worth 2% of the final grade, to give a chance for feedback on this format. I will send you comments by email or via Canvas that will be geared to help you improve your performance on the later speeches. SLO 7, 8; FO 13, 14, 15

The last two speeches will follow basically the same format as the first elevator speech, but will be worth 4% of the final grade each. SLO 7, 8

Calendar (topic/content)

A/B days indicate which attendance group is allowed to attend in person; others should attend via Zoom those days. Days marked –**L** mean you should bring your laptop that day, as we will be doing lab work.

Wk	M	W	F
	January		
1		**13** A — Introduction The idea of an algorithm	**15** B–**L** [video on Canvas] How to read/use a textbook Hello world
2	[MLK Day **no class**]	**20** A* Ch. 1 Input/output, comments	**22** B Ch. 2 for loops `range`
3	**25** A–**L** — (continued)	**27** B — Quantitative Reasoning	**29** A [reading TBA] What makes a workable quantitative question?
	February

Project program and writeup due Thu 6 May 10:30am
Exam times reserved for (online) speech overflow if needed:
Sec 1: Wed 28 Apr, 3–5:30pm **Sec 2: Thu 6 May, 8–10:30am**

* **31 March**: Deadline to withdraw from a class (5pm)

Policies

You can find several university-wide course policies at
`http://www.longwood.edu/academicaffairs/syllabus-statements/` .

Support

This is an introductory course. That means that what is covered is an important basis for other work in the field, *not* that it is supposed to be obvious, or easy. So don't feel bad if something doesn't click right away. Never hesitate to ask me a question; I'll usually at least give you a hint as to where to look next.

I'm in my office a lot (not just during posted office hours). Feel free to come in and ask questions (or just to talk). If you can't catch me in my office, email is probably your best bet.

You should also make use of your fellow students as resources. While you can't copy each other's work (see the collaboration policy), studying together is a great idea, and asking and answering questions of other students is actively encouraged.

Accommodations

If you have any special need that I can accommodate, I'm happy to do so; come speak to me early in the term so we can set things up. If you have a documented disability, you should also contact Longwood's Office of Disability Resources (Brock Hall, x2391) to discuss some of the support the college can offer you. All such conversations are confidential.

Honor code policy

Above all, I ask and expect that you will conduct yourself with honesty and integrity—and not to ignore the other ten points of the Honor Code, either. Take pride in what you are capable of, and have the humility to give credit where it is due.

The two main forms of academic dishonesty are "cheating" and "plagiarism". "Cheating" is getting help from someplace you shouldn't, and "plagiarism" is presenting someone else's idea as if it's your own. If you ever find yourself

inclined towards either of these, know that there are always other, better options. Persevere! See my website[4] for some discussion and examples of how to steer clear of these problems, and feel free to come talk to me if you need help finding some of those other options (even if it's for another course).

Cheating or plagiarism (on any assignment) will normally receive a *minimum* penalty of lowering the *course* grade by a full letter, and may range at my discretion up to an F *in the course*. Cases will also be turned in to the Honor Board. But: I believe in your potential, and I hope that you will, or will grow to, observe this policy not simply to evade punishment but positively as a matter of character.

Attendance and late policy

Attendance is required, and assignments must be turned in on time. That said, if you have a good reason to miss class or hand something in late, I tend to be fairly liberal with extensions if you ask in advance. (Good reasons do include assignments due for other classes.) (And medical and family emergencies are exempted from the "in advance" part, of course. But contact me ASAP.)

Frequent absence will result in a lowered participation grade; habitual absence may in extreme cases result in a failing grade for the class. *Unexcused* late assignments will normally be given a zero.

Inclement weather policy

I don't plan to cancel class for weather unless the entire college shuts down. If you are commuting or are otherwise significantly affected by a weather event, use your own best judgement; and if you do miss class for this reason, contact me as soon as possible to make up missed work.

Early bird policy

Nobody's perfect, and on occasion an assignment gets written a little unclearly (or, once in a while, with an actual error in it). If you catch one and bring it to my attention early, so that I can issue a clarification or correction to the rest of the class, there'll be some extra credit in it for you.

[4] `http://cs.longwood.edu/~dblaheta/collab.html`
