

Lab Convex Hull

29 November 2023

ASSUMPTIONS AND NOTES:

No three points in the input will be collinear.

At most one point on each side of the bounding box (so `findWestmostPoint` etc have a unique answer). Doesn't prevent points being in the corners!

A polygon should be a list of Points, in counter-clockwise order, which is a closed polygon if the list starts and ends on the same Point.

When writing big-O analysis: To represent total points in input, use N (e.g. O(N)). To represent number of points in correct result, which might be as big as N or might be much smaller, use H (e.g. O(H)). For the size of temporarily or partially constructed polygons, use P.

HELPER FUNCTIONS:

```

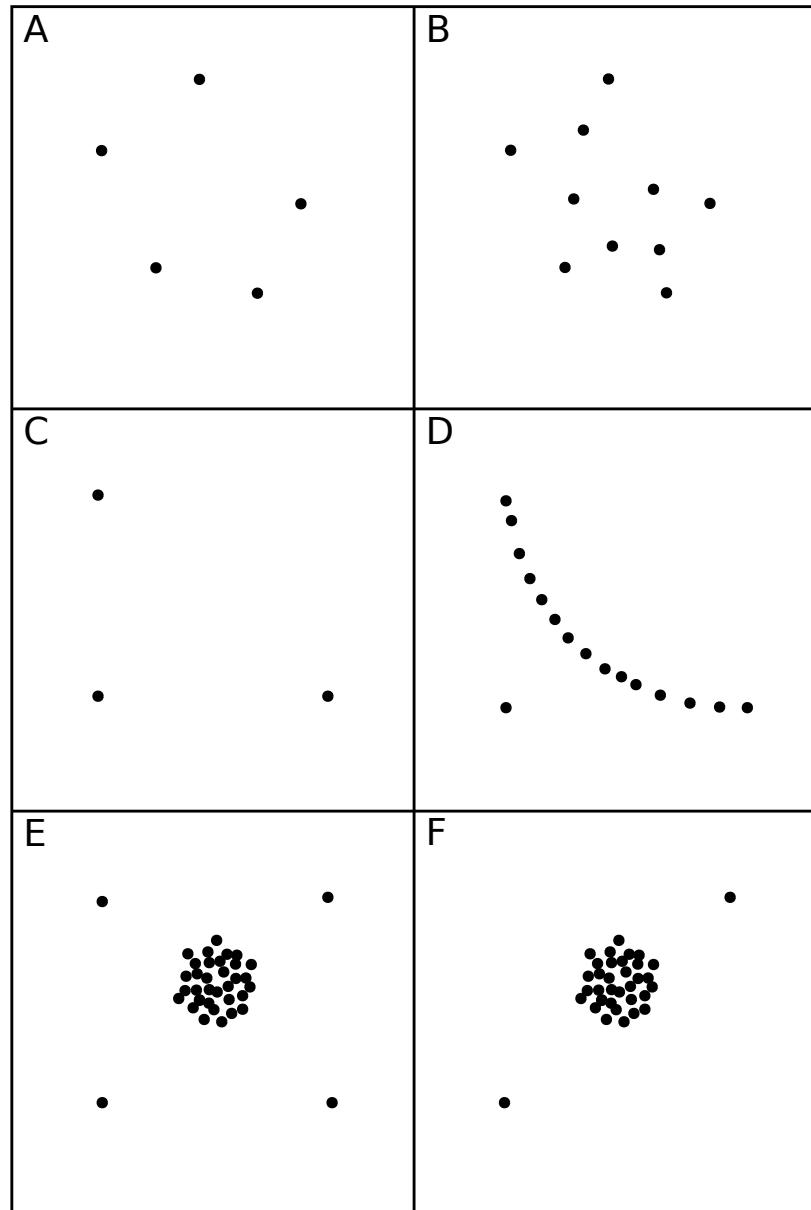

function findWestmostPoint (Set<Point> input) : Point
    (* definition not shown *)
end function

(* similarly findEastmostPoint, findNorthmostPoint, findSouthmostPoint *)

function ccw (Point p1, Point p2, Point p3) : enum(LEFT, COLLINEAR, RIGHT)
    ccwval := p1.x × p2.y + p2.x × p3.y + p3.x × p1.y
                − p1.y × p2.x − p2.y × p3.x − p3.y × p1.x
    if ccwval < 0 return RIGHT
    else if ccwval = 0 return COLLINEAR
    else (* ccwval > 0 *) return LEFT
end function

function polygonContains (List<Point> polygon, Point point) : boolean
    for i := 0 to polygon.length − 2
        if polygon[i] = point
            return true
        if ccw(polygon[i], polygon[i+1], point) = RIGHT
            return false
    return true
end function
```

SOME USEFUL TEST INPUTS:

VERSION 1:

```

function convexHull (Set<Point> input) : List<Point>
    L := new List<Pair<Point,Point>>

    foreach p1 in input
        foreach p2 in input
            hull := true
            foreach p3 in input
                if ccw(p1, p2, p3) = RIGHT
                    hull := false
                end if
            end for
            if hull
                L.add (pair(p1, p2));
            end if
        end for
    end for

    H := new List<Point>

    start := L[0].first
    H.add(start)
    current := start

    repeat
        foreach segment in L
            if segment.first = current
                current := segment.second
                H.add(current)
                break for
            end if
        end for
    until current = start

    return H
end function

```

VERSION 2:

```
function convexHull (Set<Point> input) : List<Point>
    polygon := new List<Point>

    p1 := findWestmostPoint(input) // or any extremum
    polygon.add(p1)

    keepGoing := true
    while keepGoing
        foreach p2 in input
            allLeft := true
            foreach p3 in input
                if ccw(p1, p2, p3) = RIGHT
                    allLeft := false
            end for
            if allLeft
                if p2 in polygon
                    keepGoing := false
                else
                    polygon.add(p2)
                end if
                p1 := p2
                break
            end if
        end for
    end while

    return polygon
end function
```

VERSION 3:

```

function convexHull (Set<Point> input) : List<Point>
    outerpoints := new List<Point>
    outerpoints.add(findWestmostPoint(input))
    outerpoints.add(findSouthmostPoint(input))
    outerpoints.add(findEastmostPoint(input))
    outerpoints.add(findNorthmostPoint(input))
    outerpoints.removeDups()
    (* outerpoints has 2–4 items *)
    outerpoints.add(outerpoints[0]) // close the polygon

    foreach E in input
        i := 1
        while i < outerpoints.length
            if (ccw (outerpoints[i-1], E, outerpoints[i]) = LEFT)
                outerpoints.insert(E, i)
                (* but adjacent points may no longer be on hull *)
                while (i + 2 < outerpoints.length
                    and ccw(E, outerpoints[i+1], outerpoints[i+2]) = RIGHT)
                    outerpoints.remove(i+1)
                while (i - 2 >= 0
                    and ccw(outerpoints[i-2], outerpoints[i-1], E) = RIGHT)
                    outerpoints.remove(i-1)
                break while
            end if
            i := i + 1
        end while
    end for

    return outerpoints
end function

```

VERSION 4:

```

function convexHull (Set<Point> input) : List<Point>
    north := findNorthmostPoint(input)
    south := findSouthmostPoint(input)

    lefthull := righthull := [ north, south ]
    foreach pt in input
        if ccw(south, north, pt) = LEFT
            lefthull.add(pt)
        else if ccw(south, north, pt) = RIGHT
            righthull.add(pt)
    end foreach

    lefthull.sort(southward order)
    righthull.sort(northward order)

    righthull.removeFirst()
    hull := new LinkedList<Point> // permits O(1) iterator-based insertion/removal
    hull.addAll(lefthull)
    hull.addAll(righthull)

    current := hull.iterator()
    while current has at least two after it
        if ccw(current.value, current.next.value, current.next.next.value) = RIGHT
            current.next.remove()
        if current has at least one before it
            current := current.prev
        end if
    else
        current := current.next
    end if
    end while

    return hull
end function

```

VERSION 5:

```

function convexHull (Set<Point> input) : List<Point>
  if (input size <= 3)
  then
    polygon := new List<Point>
    polygon.addAll (input)
    polygon.add (polygon.firstElement()) (* close the polygon *)
    if (input size = 3 and ccw (polygon[0], polygon[1], polygon[2]) = RIGHT)
